

TK Kit Maker

Build drumkits by copying random samples from your folders into ready-to-use kits.

MODE 1 — FASTEST

Folder Explosion

Point at a folder, get a kit. Great for a single sample pack.

MODE 2 — FULL CONTROL

Kit Builder

Define pools and slots yourself, save presets and batch-export many kit variations.

1 Installation

- 1 Unzip so the TK Kit Maker folder (with core/, ui/, data/) stays intact, somewhere under .../REAPER/Scripts/.
- 2 In REAPER, go to **Actions** → **New action** → **Load ReaScript...** and pick TK_Kit_Maker.lua.
- 3 Requires **RealmGui** — install it via ReaPack → Extensions.

Requirement

Without the RealmGui extension the script won't run. Install it first via ReaPack before loading the script.

2 Window Basics

- **Top bar:** title, a **Theme** dropdown (your choice is remembered), and a small **red dot** (top-right) to close. **Esc** also closes the window.
- Two tabs: **Folder Explosion** and **Kit Builder**.
- Fixed width; scroll vertically for longer content. The tabs always stay in view.

3 Mode 1 — Folder Explosion

"Point at a folder, get a kit." The fastest way to build a kit — great for a single sample pack.

- 1 **Source folder** — pick a folder full of samples (toggle **Include subfolders** if needed).
- 2 **Destination folder** — where the kit gets written.
- 3 **Kit layout** — set the alias (used in filenames, e.g. Kick), the **slot count**, and the **start note**.
- 4 Hit **Detonate**. A new kit folder is created with that many samples copied and renamed in order, mapped to consecutive notes.

4 Mode 2 — Kit Builder

Define the structure yourself. Everything is organised in collapsible sections.

STEP A

Pools

A **pool** is a named group of one or more sample folders.

- **+ Pool** to add one. Open it and set the **Alias**, add **folders**, toggle **Subfolders**.
- **Mode: Repeat** — samples may be reused. | **Use up** — no repeats until the pool is exhausted, then it reshuffles.
- **Scan** to count the available samples.

STEP B

Slots

Each **slot** = one sound in the kit, linked to a pool.

- **+ Slot / + 16 slots** to add rows. **Notes from 36** re-numbers notes upward.
- Per slot: choose the **Pool**, **Note**, **Pad**, and optionally **Lock** a fixed sample (that exact file is always used instead of a random one).
- On export, every slot pulls a random sample from its linked pool.

SHORTCUT

Quick Layout (128 slots)

One click to fill a full keyboard: white keys alternate between **pool A / B**, black keys all use **one pool** (e.g. Kick / Snare / Hi-hat).

Watch out: this overwrites your current slots.

STEP C

Presets

Save your pools + slots setup to reuse later.

- **Save** (type a name) — or **Update** on a listed preset to overwrite it.
- **Load** to restore; **Delete** to remove.

STEP D

Export

- **Naming** — number style, note notation, whether to include the alias, and the separator. A live **Preview** shows the resulting filename.
- **Batch** — optional kit-name prefix (empty = random name), destination folder, and **Kit count** (make many variations at once).
- Optional logs: **MIDI log**, **Sources log**, **Used-samples log** (the last one avoids repeating samples across sessions).
- **Batch export** builds the kits. Each kit is its own subfolder of copied, renamed samples.

5

Good to Know

- Exports **copy** samples — your originals are never modified.
- Presets and logs are stored in `.../REAPER/TK_Kit_Maker/`.
- If a slot shows **(no pool)** in orange, link it to a pool before exporting.
